**PYRROLIDINE DERIVATIVES HAVING PHOSPHOLIPASE A<sub>2</sub> INHIBITORY ACTIVITY**

**TECHNICAL FIELD**

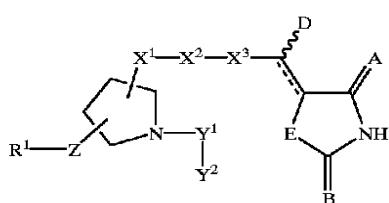

The present invention relates to novel pyrrolidine derivatives having activity of inhibiting cytosolic phospholipase A<sub>2</sub>, and the pharmaceutical composition for inhibiting the cytosolic phospholipase A<sub>2</sub> which contains a novel pyrrolidine derivative as an active ingredient.

**BACKGROUND ART**

Phospholipase A<sub>2</sub> (PLA<sub>2</sub>) is a protein capable of specifically hydrolyzing the ester bond at the sn-2-position of phospholipids, and includes cytosolic PLA<sub>2</sub> (cPLA<sub>2</sub>) and secretory type PLA<sub>2</sub> (sPLA<sub>2</sub>) which are clearly distinguishable from each other. It is known that cPLA<sub>2</sub> can selectively hydrolyze phospholipids which is esterified with arachidonic acid at the 2-position. Accordingly, the prevention of cPLA<sub>2</sub> activity would inhibit the release of arachidonic acid from phospholipids. Arachidonic acid is a precursor of prostaglandins and leukotrienes which are endobiotic substances known to be participating in the onset of inflammation. These inflammation inducers are produced through a series of processes, so called, "arachidonate cascade". Therefore, it is assumed that the inhibition of the release of arachidonic acid would suppress the production of various substances involved in inflammation and is useful for the prevention or treatment of inflammatory diseases. Examples of such diseases include rheumatoid arthritis, asthma, inflammatory bowel diseases, injury due to ischemic reperfusion, allergic rhinitis, psoriasis, and the like. The compounds having thiazolidinedion and pyrrolidine rings are disclosed in WO97/41120, WO97/41121, EP-780389-A1, JP 7-138258 (A1), and EP-528734-A1. However, there is no description about the cytosolic phospholipase A<sub>2</sub> inhibitory activity therein. WO97/05135 discloses the cytosolic phospholipase A<sub>2</sub> inhibitor but not compounds of the present invention.

**DISCLOSURE OF INVENTION**

Process 1 (XII → XIII)

This process involves the protection of secondary amine on the pyrrolidine ring (Protective Groups in Organic Synthesis, Theodora W. Green (John Wiley & Sons)). For example, the compound (XII) which is commercially available is reacted in a solvent such as tetrahydrofuran, dichloromethane, benzene, or the like in the presence of triethylamine, pyridine, or the like with a BOC-protecting agent such as 2-tert-butyloxycarbonylimino)-2-phenylacetonitrile, di-tert-butyl dicarbonate [ $(\text{BOC})_2\text{O}$ ], tert-butyloxycarbonylazide (BOC-N<sub>3</sub>), or the like a PMZ-protecting agent such as 4-methyloxycarbonylazide, 4-methyloxycarbonyl-S-(4,6-dimethylpyrimidine-2-yl) thiocarbonate, and the like, or a PNZ-protecting agent such as p-nitrobenzylchloroformate and the like so as to form a carbamate.<sup>55</sup>

## Process 2 (MIII→XIV)

This process involves the protection of hydroxy group (Protective Groups in Organic Synthesis, Theodora W. Green (John Wiley & Sons)). As the protective group of hydroxy, generally used one is usable. For example, a starting material is reacted with 3,4-dihydro-2H-pyran in dichloromethane in the presence of p-toluenesulfonic acid as a catalyst at room temperature for 5 to 8 hours to obtain a tetrahydropyranyl-protected derivative.

## Process 3 (XIV→XV)

In this process, an ester is reduced to an alcohol. For example, the reduction is carried out in a solvent such as tetrahydrofuran, and the like using a reducing agent such as lithium aluminum hydride, lithium borohydride, and the like.

## Process 4 (XV→XVI)

In this process, a hydroxy is converted into a leaving group and further converted into an azide group. Examples of leaving group include O-mesyl, O-tosyl, O-trifluoromethansulfonyl, halogen, and the like. The introduction of the leaving group is carried out according to conventional methods using mesyl chloride, tosyl chloride, trifluoromethansulfonyl chloride, phosphorous trichloride, phosphorus pentachloride, and the like.

The successive conversion into an azide derivative is carried out according to conventional methods in a solvent such as dichloromethane, hexamethylphosphoric triamide, dimethylformamide, and the like using a reagent such as sodium azide, and the like.

## Process 5 (XVI→XVII)

This process involves the removal of the hydroxy protecting group (Protective Groups in Organic Synthesis, Theodora W. Green (John Wiley & Sons)). This reaction is carried out according to conventional methods used for the deprotection of the above mentioned protecting group. When the protecting group is tetrahydropyranyl, for example, the reaction is carried out in a solvent such as methanol, and the like in the presence of p-toluenesulfonic acid in acetic acid-tetrahydrofuran-water, and the like.

## Process 6 (XVII→XVIII)

This reaction involves the reduction of azide to amine. For example, this reaction is carried out in ethanol-water, tetrahydrofuran-water, and the like in the presence of a base such as sodium hydroxide and the like by reacting with stannic chloride.

## Process 8 (XIX→XX)

In this process, an amine derivative is reacted with a carboxylic acid derivative, a thiocarboxylic acid derivative, or a sulfonic acid derivative according to the activated ester method, the acid chloride method, the mixed acid anhydride method and the like to obtain an amide derivative, a thioamide derivative, or a sulfonamide derivative. This process is carried out in a solvent such as tetrahydrofuran, dichloromethane, toluene, benzene, and the like. In the activated ester method, the reaction is carried out using a condensing agent such as 1-hydroxybenzotriazole, hydroxysuccinimide, dimethylaminopyridine, and the like and dicyclohexylcarbodiimide, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride, and the like. In the acid chloride method, a free acid is converted into an acid chloride using a reagent such as thionyl chloride

and oxaryl chloride to obtain an aimed compound. In the mixed acid anhydride method, a carboxylic acid is converted into mixed acid anhydride using ethylchloroformate, isobutylchloroformate, and the like. These reactions are carried out in the presence of a base such as triethylamine, pyridine, and the like, if necessary. This process is, for example, carried out in a solvent such as N,N-dimethylformamide and the like by reacting a starting material with 4-(4-oxo-2-thioxothiazolidine-5-ylidemethyl)benzoic acid, 4-(2,4-dioxothiazolidine-5-ylidemethyl)benzoic acid, and the like which are described in JP05306224 and Can. J. Chem., 1958, 36, 1579. in the presence of 1-hydroxybenzotriazole, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride, and the like.

## Process 9 (XX→XXI)

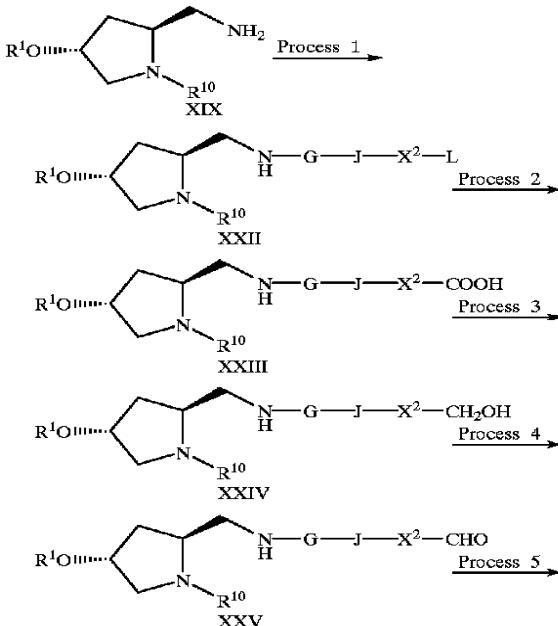

This process involves the deprotection of the protected N-atom of the pyrrolidine ring (Protective Groups in Organic Synthesis, Theodora W. Green (John Wiley & Sons)). This reaction is carried out by usual methods used for the deprotection of the above mentioned protecting group. When the protecting group is tert-butyloxycarbonyl, the reaction is, for example, carried out in a solvent such as methanol, ethyl acetate, and the like by reacting with 5 to 20 equivalents of a mineral acid such as hydrochloric acid, hydrobromic acid, and the like for 2 to 6 hours. The reaction mixture is concentrated in vacuo to give a corresponding acid salt of the aimed compound.

## 30 Process 10 (XX→I-1)

This reaction involves the formation of an amide, a sulfonamide, an urea, or a thiourea. For example, the formation of an amide bond is carried out by reacting with an acyl halide in the presence of a base such as triethylamine or pyridine, if necessary. When the acylating agent is a carboxylic acid, the reaction can be conducted in a manner similar to that described in above process 8.

#### Process 1 (XIX→LXIV)

-continued

Wherein A, B, E, G, R<sup>1</sup>, R<sup>9</sup>, R<sup>10</sup>, Y<sup>1</sup>, Y<sup>2</sup>, and a wavy line are as defined above, W is a leaving group, Ac is acetyl, and Tr is trityl.

25 Process 1 (XII→LXXI)

This process involves the protection of a secondary amine of the pyrrolidine ring, followed by conversion of a 4-hydroxy group to a leaving group. N-protecting reaction can be carried out in a manner similar to that described in

30 Process 1 of Method A-1.

Successively, a hydroxy group is converted into a leaving group. Examples of the leaving group are O-mesyl, O-tosyl, O-trifluoromethansulfonyl, halogen, and the like. This introduction of these leaving groups is carried out by usual 35 methods using mesyl chloride, tosyl chloride, trifluoromethansulfonyl chloride, phosphorous trichloride, phosphorous pentachloride, and the like (JP-5-294970(A1)).

Process 2 (LXXI→LXXII)

Process 3 (LXXI→LXXIII)

45 The purpose of this process is the same as Process 2 except that tritylthio is introduced instead of acetylthio. This process is, for example, carried out in a solvent such as dimethylformamide, tetrahydrofuran, and the like by reacting with sodium tritylthilate and the like.

50 Processes 4 and 5 (LXXII, LXXIII→XXIV)

In this process, —S—R<sup>1</sup> derivative is obtained by reacting a sodium salt, which is prepared by the deprotection of a sulfur substituent, with a haloid such as an alkyl halide (e.g., iodomethane and 2-bromopropane), an alkenyl halide 55 (geranyl halide), an aralkyl halide (benzyl bromide), and the like. For example, the Process 4 is carried out in a solvent such as methanol, toluene, dimethylformamide, and the like by reacting with sodium methylate and the like, and successively adding the above mentioned haloid to give a derivative having —S—R<sup>1</sup> group at the 4-position.

In the Process 5, the trityl group is deprotected by using silver nitrate to give a silver salt, which is treated with hydrogen sulfide to give a thiol derivative. This is converted into S-sodium salt derivative, which then is reacted with the 65 above mentioned haloid to give —S—R<sup>1</sup> derivative. This process is, for example, carried out in a solvent such as methanol and the like by adding silver nitrate and collecting

33

precipitated crystals or extracting the silver salt. Successively, the silver salt is reacted with hydrogen sulfide in a solvent such as dichloromethane, tetrahydrofuran, and the like to give a 4-thiol derivative, which is reacted with sodium methylate in a solvent such as toluene, methanol, dichloromethane, and the like to produce an S-sodium salt, which may optionally be concentrated to dryness for isolation, then the salt is reacted with the above mentioned haloid to give —S—R<sup>1</sup> derivative.

## (1) 8→11

To a solution of the compound (8) (1.16 g, 3.0 mmol) which was prepared in Example 1 in dimethylformamide (30 ml) were added thiophen-2,5-dicarboxylic acid monodiphenylmethylester (1.0 g, 3.0 mmol), 1-hydroxybenzotriazole hydrate (450 mg, 3.3 mmol), and 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (640 mg, 3.3 mmol) at room temperature and the resulting mixture was stirred for 17 h. The reaction mixture was poured into water. To this mixture was added 2N hydrochloric acid aq.

for adjusting acidic condition and resulting mixture was extracted with ethyl acetate. The organic layer was washed with 5% sodium hydrogencarbonate aq., water, and brine, dried over sodium sulphate, and concentrated in vacuo. The residue was subjected to silica gel column chromatography (hexane:ethyl acetate=3:1) to give 1.51 g (71%) of the aimed compound (11).

45 Test Example 1 cPLA<sub>2</sub> Inhibitory Activity

The compounds of the present invention were tested for the cPLA<sub>2</sub> inhibitory activity according to the method disclosed in R. M. Kramer, E. F. Roberts, J. Manetta, and J. E. Putnam, J. Biol. Chem., 1991, 266, 5268–5272 as outlined below.

Using the 1-palmitoyl-2-[<sup>14</sup>C]-arachidonoyl-sn-glycero-3-phosphocholine as a substrate, liposomes (a substrate solution) containing the substrate of which concentration was 2.5  $\mu\text{M}$  in the reaction mixture and sn-1,2-dioleoylglycerol of which concentration was 1.25  $\mu\text{M}$  in the reaction mixture at the molar ratio of 2:1 were prepared. The reaction mixture includes 50 mM HEPES buffer (pH 7.5), 1 mM calcium chloride, 150 mM sodium chloride, 0.1 mg/ml bovine serum albumin, and 1.7 mM dithiothreitol. To the reaction mixture was added the compound of the present invention and the substrate solution. The reaction was allowed to start by adding an enzyme and continued for 15 min at 37° C. The fatty acids released by the reaction were extracted by the method described in V. P. Dole, and H. Meinertz, J. Biol. Chem., 1960, 235, 2595–2599 and its radiation activity was measured on a liquid scintillation counter. Control was obtained by conducting the experiment

in the same manner except that a compound of the present invention was not added. The results were shown in Tables 32 to 35.

## FORMULATION EXAMPLE

## Formulation Example 1

Granules are prepared using the following ingredients.

Ingredients	The compound represented by the formula (I)	10 mg
	Lactose	700 mg
	Corn starch	274 mg
	HPC-L	16 mg
		1000 mg

The compound represented by the formula (I) and lactose were made pass through a 60 mesh sieve. Corn starch was made pass through a 120 mesh sieve. They were mixed by a twin shell blender. An aqueous solution of HPC-L (low mucosity hydroxypropylcellulose) was added to the mixture and the resulting mixture was kneaded, granulated (by the extrusion with pore size 0.5 to 1 mm mesh), and dried. The dried granules thus obtained were sieved by a swing sieve (12/60 mesh) to yield the granules.

## Formulation 2

Powders for filling capsules are prepared using the following ingredients.

Ingredients	The compound represented by the formula (I)	10 mg
Lactose	79 mg	
Corn starch	10 mg	
Magnesium stearate	1 mg	
		100 mg

The compound represented by the formula (I) and lactose were made pass through a 60 mesh sieve. Corn starch was made pass through a 120 mesh sieve. These ingredients and magnesium stearate were mixed by a twin shell blender. 100 mg of the 10-fold trituration was filled into a No. 5 hard gelatin capsule.

## Formulation 3

Granules for filling capsules are prepared using the following ingredients.

Ingredients	The compound represented by the formula (I)	15 mg
Lactose	90 mg	
Corn starch	42 mg	
HPC-L	3 mg	
		150 mg

The compound represented by the formula (I) and lactose were made pass through a 60 mesh sieve. Corn starch was made pass through a 120 mesh sieve. After mixing them, an aqueous solution of HPC-L was added to the mixture and the resulting mixture was kneaded, granulated, and dried. After the dried granules were lubricated, 150 mg of that were filled into a No. 4 hard gelatin capsule.

## Formulation 4

Tablets are prepared using the following ingredients.

Ingredients	The compound represented by the formula (I)	10 mg
Lactose	90 mg
